

Basics of Pointers and Arrays

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Key Points (excuse the pun)

1) How memory allocation works

Assignment Project Exam Help

<https://powcoder.com>

2) How to create pointers to variables in memory in c

Add WeChat powcoder

3) How to differentiate between an address in memory for a variable and its value (referencing / dereferencing)

4) How to create arrays and why arrays are really just pointers

Finding memory addresses in c

&x -> memory address of variable x (this is called referencing a variable)

```
#include<stdio.h>
int main()
{
    int x=0;
    printf("value of x = %d,", x);
    // following code computes the address of x through &x, and recasts this as a typeless "pointer" so c can print (void *)
    printf("address that x is stored in is %p\n", (void *)&x);
    return 0;
}
```

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Output of code:

```
value of x = 0,address that x is stored in is 0x7ffff6f81d54
```

Finding memory addresses in c

&x -> memory address of variable x (this is called referencing a variable)

```
#include<stdio.h>
int main()
{
    int x=0;
    printf("value of x = %d,", x);
    // following code computes the address of x through &x, and recasts this as a typeless "pointer" so c can print (void *)
    printf("address that x is stored in is %p\n", (void *)&x);
    return 0;
}
```

Add WeChat powcoder

Output of code:

```
value of x = 0,address that x is stored in is 0x7ffff6f81d54
```

Pointers

- A pointer stores a memory address.
- The type of the pointer is used by the compiler to see how much memory is stored there.

Pointers

- A pointer stores a memory address.
- The type of the pointer is used by the compiler to see how much memory is stored there.

Assignment Project Exam Help

<https://powcoder.com>

- In c the character * denotes an integer that points to an address.
- This is what we call “dereferencing” a “pointer”

- In c the character * denotes an integer that points to an address.
- This is what we call “dereferencing” a “pointer”

Add WeChat powcoder

- **Note that c DOES NOT enforce safety with pointers.**
 - You can do many twisted and perverse things with pointers

Arrays

- Int a[4] -> array of 4 integers. char c[4] -> array of 4 characters.

```
#include<stdio.h>
int main()
{
    //initialize a 1D array with 4 entries
    int a[4]={4,3,2,1};
    for (int i=0; i<4; i++)
    {
        printf("a[%d]=%d,",i,a[i]);
    }
    printf("\n");

    //initialize a 2D array with 2x4 = 8 entries
    int b[2][4]={{1,2,3,4},{5,6,7,8}};
    for (int i=0; i<2; i++)
    {
        for (int j=0; j<4;j++)
        {
            printf("b[%d,%d]=%d,", i,j,b[i][j]);
        }
        printf("\n");
    }
}
```

Assignment Project Exam Help

Add WeChat powcoder

```
a[0]=4,a[1]=3,a[2]=2,a[3]=1,
b[0,0]=1,b[0,1]=2,b[0,2]=3,b[0,3]=4,
b[1,0]=5,b[1,1]=6,b[1,2]=7,b[1,3]=8,
```

Arrays

- `Int a[4]` -> array of 4 integers. `char c[4]` -> array of 4 characters.

Assignment Project Exam Help

- An array is actually really a pointer to a block of memory.

Add WeChat powcoder

Arrays

- `int a[4]` -> array of 4 integers. `char c[4]` -> array of 4 characters.

Assignment Project Exam Help

- An array is actually really a pointer to a block of memory.

<https://powcoder.com>

Add WeChat powcoder

C does not prevent you from accessing `a[5]`

(because the address is a valid part of mem)

You may get a segmentation fault if the memory is protected

Demo

- Now onto the most dangerous part of the lecture: the live demo!

Stack frame

- The stack frame keeps track of all the memory that has been allocated and tracks the address of each variable.

<https://powcoder.com>

Add WeChat powcoder

```
#include<stdio.h>
int main()
{
    int x = 5;
    int y = 9;
    printf("5 * 9 = %d\n",x*y);
    return 0;
}
```

Stack frame

- The stack frame keeps track of all the memory that has been allocated and tracks the address of each variable.
